Galaxy Quest   Version 1.0

By Erik Anderson aka Sputnik   erik_h_anderson@hotmail.com

Thanks to:
Atra-Hasis, for the Protector mesh.
MorBus, for the shuttle mesh.
Vinka, for Spacecraft3, which makes this add-on easy and fun.

And, above all, many thanks go to Martin Schweiger, for actually developing the simulator I used
        to daydream about in astrodynamics classes!

                                                                    http://www.orbitersim.com

---

Unpacking:

    Use Winzip to put each subfolder in its matching Orbiter folder.
    This add-on includes the Spacecraft3 distribution.

Introduction:

    Welcome to the Galaxy Quest add-on!

This is just the NSEA Protector, the interstellar cruiser from the movie Galaxy Quest, and its shuttlecraft (termed a "surface pod"). Performance is science-fictiony, unrealistically, fun.
No Thermians were harmed in the making of this add-on.

Operation:

Protector Keys:

J – Unships the shuttle, and docks it in the aft bay.

Shuttle Keys:

G – Extend/retract the landing gear.

The J key will prep the shuttle, first time only. After that, you can dock and undock from a virtual docking port in the aft shuttlecraft bay. Sorry, the Protector has no shuttle bay door animation; you'll have to fly right through it.

Version history:

V1.0
 First release.
